New Holland Construction launches first SCR models

by Chris Goodfellow

New Holland Construction's new Tier IV Interim-compliant equipment, including wheel loaders and crawler excavators, is to be launched at Italian earthmoving and building machinery exhibition Samoter on the 2 March 2011.

The new E305C crawler excavator and the two-wheel loader models, the W170C and W190C, all feature New Holland's Selective Catalytic Reduction (SCR) technology and use AdBlue to achieve compliance with Tier IV Interim emissions regulations.

A spokesperson for the company said: "AdBlue is easy to find through all New Holland dealerships, and the tank only needs to be refilled every 4th or 5th fuel tank refill.

"With New Holland's SCR solution, the combustion process is optimized for maximum efficiency, so less fuel is consumed and more power is generated."
